This sequence represents a human immunodeficiency virus type 1 (HIV-1) R2 strain envelope (env) protein V3 region peptide sequence. The invention relates to the HIV-1 env protein or its fragments, which when administered to a mammal, induces the production of broadly cross-reactive neutralising anti-serum against multiple strains of HIV-1. The HIV-1 env protein and its fragments are useful as vaccines, immunogenic compositions or diagnostic reagents. They can also be used to detect anti-HIV-1/HIV-1 neutralizing antibodies in a sample. The amino acid sequence and its fragments or maNA sequence are useful for generating antibodies in a mammal. In addition, a recombinant delivery vector containing the env amino acid sequence may also be used as a vaccine. (Updated on 12-SBE -2003 to standardise OS field)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Human immunodeficiency virus-1 envelope protein, useful as a vaccine or immunogenic preparation against HIV-1 infection induces the production of broadly cross-reactive neutralizing anti-serum.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                HIV-1; envelope protein; env; cross reactive anti-serum; antibody; vaccine; antibody; V3 region; detect.

The sequences represented in AAQ21054-61, AAQ21194-311 and AAQ21321-78 encode PNDs of HIV (envelope protein) which are useful as immunogens for ALDS vaccines, partic. in the form of conjugates. To prepare antigenic conjugates, PND (of HIV) and Omp (of Neisseria) are prepar separately, then linked by cross-linking agents, monogeneric spacers or bigeneric spacers. The conjugate may comprise 1-50 PNDs. A PND has 35 amino acids or less, but at least 5, it contains Gly-X-Gly, where X is Pro, Leu, Ala Gln or Ser. The conjugates as AIDS or HIV vaccines can be used pre- or post- exposure to prevent or treat HIV infection or disease, and are capable of producing an immune response specific for the immunogen. See also AAQ21052-61, AAQ21194-311 and AAQ21321-78
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         covalently linked to outer membrane proteosome of Neisseria, useful as vaccine and in treating and preventing HIV infections, AIDS and ARC.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New antigenic conjugate of HIV major neutralisation determinant
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 HIV; PND; principal neutralising determinant; Omp; Neisseria; outer membrane proteosome; AIDS; vaccine; envelope gene.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     g
                                                                                                           ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 This sequence represents a human immunodeficiency virus type 1 (HIV-1) envelope (env) protein amino acid sequence. The invention relates to the HIV-1 env protein or its fragments, which when administered to a mammal, induces the production of broadly cross-reactive neutralising anti-serum against multiple strains of HIV-1. The HIV-1 env protein and its reagents are useful as vaccines, immunogenic compositions or diagnostic reagents. They can also be used to detect anti-HIV-1/HIV-1 neutralizing antibodies in a sample. The amino acid sequence and its fragments or mRNA sequence are useful for generating antibodies in a mammal, In addition, a recombinant delivery vector contening the env amino acid sequence may also be used as a vaccine. The sequences represented in AAQ21054-61, AAQ21194-311 and AAQ21321-78 encode PNDs of HIV (envelope protein) which are useful as immunogens for AIDS vaccines, partic. in the form of conjugates. To prepare antigenic conjugates, PND (of HIV) and Omp (of Neisseria) are prepd. separately, then linked by cross-linking agents, monogeneric spacers or bigeneric spacers. The conjugate may comprise 1.50 PNDs. A PND has 35 amino acids or less, but at least 5, it contains Gly-X-Gly, where X is Pro, Leu, Ala, Gln or Ser. The conjugates as AIDS or HIV vaccines can be used pre- or peach or prevent or treat HIV infection or disease, and are capable of producing an immune response specific for the immunogen. See also AAQ21052-61, AAQ21194-311 and AAQ21321-78
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New antigenic conjugate of HIV major neutralisation determinant - covalently linked to outer membrane proteosome of Neisseria, useful as vaccine and in treating and preventing HIV infections, AIDS and ARC.
                                                                                                                                         New antigenic conjugate of HIV major neutralisation determinant - covalently linked to outer membrane proteosome of Neisseria, useful vaccine and in treating and preventing HIV infections, AIDS and ARC.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          HIV; PND; principal neutralising determinant; Omp; Neisseria; outer membrane proteosome; AIDS; vaccine; envelope gene.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The sequences represented in AAQ21054-61, AAQ21194-311 and AAQ21321-78 encode PNDs of HIV (envelope protein) which are useful as immunogens for AIDS vaccines, partic. in the form of conjugates. To prepare antigenic conjugates, PND (of HIV) and Omp (of Neisseria) are prepar separately, then linked by cross-linking agents, monogeneric spacers or bigeneric spacers. The conjugate may comprise 1-50 PNNs. A PND has 35 amino acids or less, but at least 5, it contains Gly-X-Gly, where X is Pro, Leu, Ala, gost- exposure to prevent or treat HIV infection or disease, and are capable of producing an immune response specific for the immunogen. To prepare antigenic conjugates, PND (of HIV) and Omp (of Neisseria) are prepal, separately, then linked by cross-linking agents, monogeneric spacers or bigeneric spacers. The conjugate may comprise 1-50 PNDs. A PND has 35 amino acids or less, but at least 5, it contains Gly-X-Gly, where X is Pro, Leu, Ala, Gln or Ser. The conjugates as AIDS or HIV vaccines can be used prepost- exposure to prevent or treat HIV infection or disease, and are capable of producing an immune response specific for the immunogen. See also AAQ21052-61, AAQ21194-311 and AAQ21321-78

To prepare antigenic conjugates, PND (of HIV) and OMP (of Neisseria) are prepd. separately, then linked by cross-linking agents, monogeneric spacers or bigeneric spacers. The conjugate may comprise 1-50 PNDs. A PND has 35 amino acids or less, but at least 5, it contains Gly-X-Gly, where X is Pro, Leu, Ala, Gln or Ser. The conjugates as AIDS or HIV vaccines can be used precapble of producing an immune response specific for the immunogen. See also AAQ21052-61, AAQ21194-311 and AAQ21321-78
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New antigenic conjugate of HIV major neutralisation determinant -
covalently linked to outer membrane proteosome of Neisseria, useful as
vaccine and in treating and preventing HIV infections, AIDS and ARC.

The sequences represented in AAQ21054-61, AAQ21194-311 and AAQ21321-78 encode PNDs of HIV (envelope protein) which are useful as immunogens for AIDS vaccines, partic. in the form of conjugates. To prepare antigenic conjugates, PND (of HIV) and OMP (of Neisseria) are prepd. separately, then linked by cross-linking agents, monogeneric spacers or bigeneric spacers. The conjugate may comprise 1-50 PNDs. A PND has 35 amino acids or less, but at least 5, it contains Gly-X-Gly, where X is Pro, Leu, Ala, Gln or Ser. The conjugates as AIDS or HIV vaccines can be used pre- or payener to prevent or treat HIV infection or disease, and are capable of producing an immune response specific for the immunogen.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The sequences represented in AAQ21054-61, AAQ21194-311 and AAQ21321-78 encode PNDs of HIV (envelope procein) which are useful as immunogens for AIDS vaccines, partic. in the form of conjugates. To prepare antigenic conjugates, PND (of HIV) and Omp (of Neisseria) are prepal. separately, then linked by cross-linking agents, monogeneric spacers or bigeneric spacers. The conjugate may comprise 1-50 PNDs. A PND has 35 amino acids or less, but at least 5, it contains Gly-X-Gly, where X is Pro, Leu, Ala, Gln or Ser. The conjugates as AIDS or HIV vaccines can be used prepost-exposure to prevent or treat HIV infection or disease, and are capable of producing an immune response specific for the immunogen.                                                                                                                                                      The sequences represented in AAQ21054-61, AAQ21194-311 and AAQ21321-78 encode PNDs of HIV (envelope protein) which are useful as immunogens for ADGS vaccines, partic. in the form of conjugates. To prepare antigenic conjugates, PND (of HIV) and OMP (of Neisseria) are prepd. separately, then linked by cross-linking agents, monogeneric spacers or bigeneric or less, but at least 5, it contains Gly-X-Gly, where X is Pro, Leu, Ala, Gln or Ser. The conjugates as AIDS or HIV vaccines can be used pre- or pass-to prevent or treat HIV infection or disease, and are capable of producing an immune response specific for the immunogen. DNA encoding HIV PND peptides was PCR amplified using genomic DNA from HIV-infected peripheral blood monouncleic cells as template. The amplified fragments were fused to beta-galactosidase coding sequence.

E.coli transformants were cultured to produce the fusion protein. The expressed PND proteins were divided into groups based on their reactivity with neutralising antibodies and their amino acid sequence. The amino acid sequence was analysed using Robson's analytical program for protein secondary structure. Five groups were included in 3 main groups (i.e. groups I, II and III). Group II PND peptides are those which have the structure and X = turn or coil structure). Vaccine preparations strand structure and X = turn or coil structure). Vaccine preparations to develop vaccines able to recognise any HIV variant. See AAQ31607- (231608, AAR28995-R29000 and AAR29110-R29128. (Updated on 25-MAR-2003 to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Novel genomic nucleic acids of non-subtype B human immunodeficiency virus type 1 useful for detecting and treating AIDS comprises a specific

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The sequences represented in AAQ21054-61, AAQ21194-311 and AAQ21321-78 encode PNDs of HIV (envelope protein) which are useful as immunogens for ADS vaccines, partic. in the form of conjugates. To prepare antigenic conjugates, PND (of HIV) and Omp (of Neisseria) are prepat separately, then linked by cross-linking agents, monogeneric spacers or bigeneric spacers. The conjugate may comprise 1-50 PNDs. A PND has 35 amino acids or less, but at least 5, it contains Gly-X-Gly, where X is Pro, Leu, Ala, Gln or Ser. The conjugates as AIDS or HIV vaccines can be used pre- or post-exposure to prevent or Treat HIV infection or disease, and are capable of producing an immune response specific for the immunogen.                                          HIV-1
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New antigenic conjugate of HIV major neutralisation determinant - covalently linked to outer membrane proteosome of Neisseria, useful as vaccine and in treating and preventing HIV infections, AIDS and ARC.
                                                                                                                                                    Gaps
number of human immunodeficiency virus (HIV) type 1 non-subtype B isolates. The sequences shown include the near full-length coding sequences from each isolate, and the env, pol, vif, vpr, vpu, gag, rev and nef proteins. These can be used to detect the presence of H in a sample and to produce antibodies against non-subtype B HIV-1 v These antibodies can be used in vaccines to prevent and treat HIV infection. To prepare antigenic conjugates, PND (of HIV) and OMP (of Neisseria) are prepd. separately, then linked by cross-linking agents, monogeneric spacers or bigeneric spacers. The conjugate may comprise 1-50 PNDs. A PND has 35 amino acids or less, but at least 5, it contains Gly-X-Gly, where X is Pro, Leu, Ala, Gln or Ser. The conjugates as AIDS or HIV vaccines can be used pre- or payer to prevent or treat HIV infection or disease, and are capable of producing an immune response specific for the immunogen. N;Alternate names: coat polyprotein
N;Contains: amino end of coat protein gp41; carboxyl end of coat protein gp120
C;Species: human immunodeficiency virus type 1, HIV-1
A;Note: host Homo sapiens (man)
C;Date: i1-Feb_1993 #sequence_revision 31-Dec-1993 #text_change 09-Jul-2004
